5. Violin

[Florence, 1770 ca.]

Giovanni Battista Gabbrielli (attr.)

(Florence, 1716–1771)

Inv. Cherubini no. 1088/9

Description

The **BELLY** is made of two quarter out pieces of spruce (*Picea abies* Karst.) with hazel figure markings and medium-wide grain converging towards the joint (mean width 1.8 mm at the centre, 2.1 mm at the edges). The two pieces come from the same log although a 22.4 mm wide strip was cut from the centre of the piece on the right. The grain shows an anomaly in the wood growth near the edge of the left C-bout, but not on the right side. There are no positioning pins.

The arching is well-shaped with deep and wide fluting. It reaches its maximum height between the upper eyes of the F-holes.

The F-holes are short and vertical with small eyes, wings with diverging sides and no fluting. The notches are small, and those of the left F-hole are inverted, the outer one lower than the inner, while the notches on the right F-hole are quite slanted (63°).

The corners are elongated with similar openings on the lower and upper corners, defining very open C-bouts (83 mm). The thickness is only slightly greater than that of the edge.

The purfling consists of three lines: the middle line is beech wood (*Fagus sylvatica* L.) while the two outer rows are of stained, unidentified wood (total thickness 1.6 mm; white 0.5 mm). The purfling joint is very precise, centrally placed at the corners and reaches almost their end. The distance from the edge is 3.2 mm.

The ebony (*Diospyros* sp.) saddle is not original; it is very narrow and high on the belly; it protrudes beneath the belly and overlaps the rib. It also cuts into part of the brand mark on the belly.

The **SACK** comprises two pieces of quarter cut maple (*Acer* sp.). The right board has a slight flame pattern descending towards the edge, while there is no curl on the left piece. There are no positioning pins.

The arching reflects the style of the belly with deeper fluting that gives it more emphasis notwithstanding a slight deformation caused by the pressure of the sound-post. The maximum height just below the upper corners is higher than that of the belly.

The corners also reflect the style of the belly and are thicker than the rest of the edge.

The purfling is made of the same material as the purfling on the belly, but the black lines are narrower.

The original, intact **BUTTON** is rather wide at the base, semi-circular, and is notably thicker at the top than at the base.

The six ribs are made of nearly quarter cut maple (*Acer* sp.) with a flame pattern that is barely visible on the lower ribs and perpendicular to the surface of the back. The bending of the wood near the corners caused wrinkling on the wood surface.

The blocks are made of conifer wood with characteristics compatible with fir; except for the upper block made of walnut they are all original. The linings are original, made of broadleaved wood with features compatible with beech wood. The linings are not inserted into the blocks and in some cases are too short and do not reach them. The bassbar is very small, thin and may be original.

The maple (*Acer* sp.) NECK, without any flaring is original. Its angle was modified by the insertion of two wedges between the heel and the upper block and between the heel and the button creating an elevation of 4.5 mm and an angle of 7° with respect to the surface. The bone nut was moved upwards to lengthen the body stop, so now it is beyond the base of the pegbox.

The work is similar to what was done on instrument inv. no. 1988/6 (cat. no. 18) and can be attributed to the same hand.

The ebony (*Diospyros* sp.) fingerboard is not original.

The HEAD is of one piece with the neck. The pegbox is narrow, the base forms a 113° angle with the surface of the neck, and is coarsely dug out at the top. The pegbox flanks are slender and of the same width throughout the length.

The scroll is slightly twisted towards the left in relation to the pegbox. However, it is well-proportioned and develops evenly notwithstanding some asymmetry. The beginning of the spiral is anticipated at the eye by a slender scratch. The sides of the back of the scroll converge slightly and the heel of the scroll is deeply fluted and protrudes notably.

The VARNISH is golden brown.

The instrument has NO LABEL. However, there are three BRAND MARKS with the initials 'G-B-G' within a rectangle made with the same punch used for violin inv. no. 1988/6 (cat. no. 4): they are on the button, at the joint of the lower ribs below the endbutton and on the belly near the saddle. There are no visible markings inside the instrument.

The modern pear wood (*Pyrus* sp.) pegs are decorated with a bone button on the sides.

Dendrochronological dating of the belly

Fifty-two and forty-eight rings were counted on the right and left boards respectively. The mean chronology of

fifty-eight rings cross-matches with some Central European chronologies, including Wilson's that is applicable to Germany (Falkenstein). Dating of the last measured ring: 1768, T_{sp} 4,60, Gk: 73,30^{***}. The dating can be considered reliable.

State of conservation

Even though it shows some signs of wear the instrument is in fair condition. The BELLY presents a significant fracture along the grain involving the entire lower right from the edge to the eye of the F-hole; it was reglued and consolidated with a single square reinforcement. There are some nicks, especially beneath the tailpiece. The edge, which is generally quite worn, was repaired at the upper and lower bouts, while the corners are very worn but original. A 20 mm long crack along the edge – from where the above mentioned crack begins, required doubling of the upper part of the edge and the replacement of the purfling in that section.

The BACK is in good condition even though it has some scratches and shows signs of moderate wear.

The RIBS are in fair condition: the upper right rib has a small crack near the block that was reglued from the inside. There is no other damage aside from a significant bulge on either side of the lower block.

The NECK and HEAD are in fair condition, but the right pegbox flank has some unrepaired cracks between the E and G pegs and above the A peg. The area around the D peg on the left flank was doubled on the outside. The neck shows a 9 mm crack on the right side just under the head.

Historical documentation

See preceding entry (cat. no. 4). This instrument also comes from the Accademia del Regio Istituto Musicale. In an appraisal dated 1867 it is listed as 'ordinary' from the qualitative standpoint and was valued at only 50 lire, half the amount of the other Gabrielli violin.¹

The 1867 report by Castellani described this instrument as 'fairly well set up' and, because of its 'ordinary quality' advised against the work planned for the other instruments.²

In 1947 Alfredo Del Lungo submitted an invoice for the repair of the volute on the scroll and of a crack in the lower left part of the belly.³

Then in 1988, within the context of the restorations commissioned after the 1966 flood, he presented a bill for regluing the body, cleaning the inside, smoothing the fingerboard, touching-up the original varnish and polishing the neck, replacing the

string and a general revision.⁴

Critical history

In 1911 Bargagna described the instrument as 'entirely identical to the preceding one and the label has the same information' this would suggest the existence of a label that was lost before 1969 when Gai stated that it was missing. However, it is strange that this was the only case in which Bargagna did not transcribe the text of the label, so it is possibly legitimate to assume that he was referring to the brand mark.

Stylistic notes

This violin is slightly narrower and longer than the preceding one. It does have the same stylistic features even though they are less carefully wrought, perhaps because of the maker's advanced age. The cut and placement of the F-holes and the purfling have the same characteristics. His choice of wood with a wider grain for the belly, however, led to greater thicknesses.

The workmanship on the scroll is highly asymmetrical especially when viewed from the front and back, and in particular the development of the second turn. The hollowing on the heel of the scroll is deeper on this violin than on the preceding instrument.

The inlay channels and the thickness of the black lines of the purfling are also less even than in the previous instrument. Furthermore the white purfling is further extended towards the end of the corners.

The beautiful golden brown varnish is lighter than that of the preceding violin, but its consistency is similar.

ilan, 1748-1780)

Cherubini 1988/82

Description

The **SOUNDBOARD** is one piece of near quarter cut Norway spruce (*Picea abies*), with the growth direction from the bass towards the treble side, and grain that is particularly narrow towards the treble. There is one narrow strip of ebony (*Diospyros* sp.) purfling let into half the depth around the edge adjacent to the soundboard and a wider strip of bone purfling. The **SOUNDHOLE** is covered by a rosette consisting of two overlapping layers of wood (conifer beneath, broadleaved above) on paper; there is a hexagonal-base plant motif. It is supported by three **BRACES** that are more or less perpendicular to the bridge and six others placed horizontally: two above the soundhole, three adjacent to it, and one below. The soundboard is encircled by a single strip of dark wood purfling. Traces of a first, and abandoned, attempt at positioning the soundhole are clearly visible on the soundboard: it is slightly lower and to the right of the existing soundhole. The **TIE-BRIDGE** is walnut (*Juglans regia*), the flat front is decorated with two strips of purfling in bone and a strip of mother-of-pearl separated by ebony. It is probably not original and, by way of the glue's fluorescence, can be traced back to a restoration that included adding a large piece of protective ebony set at an angle and partially covering the lower part of the soundboard and capping strip.

The **BOWL** consists of fifteen ribs of cypress (*Cupressus sempervirens*), with shallow fluting that alternates with ebony spacers. The glue is reinforced with strips of white paper inside the bowl. The **CAPPING STRIP** is cypress, with short moustaches that have no decorative motifs.

Inside the bowl, there is a printed **LABEL**, the bottom faces the treble side, and reads: "Giuseppe, e Carlo Fratelli Fiscer/ Fabbricatori d'Istrumenti in/ Milano vicino alla Balla/ 1764".

The **NECK** is black-stained maple (*Acer* sp.), and the fingerboard comprises six mother-of-pearl plaques, with sgraffito landscape motifs alternating with narrow bone (the first, third, sixth and seventh on the joint with the neck) and complanate ebony frets, marking the position of the gut frets. The last fret before the joint with the soundboard, between the sixth and seventh fret, is covered by the soundboard; there is one mother-of-pearl decoration at the centre, and two on the sides that extend onto the soundboard forming the moustaches. Two strips of bone purfling decorate the side edges. The finely modelled bone **TOP NUT** is original. The black-stained pear wood (*Pyrus* sp.) **PEGBOX**, is elongated and surmounted by a slightly trapezoidal mother-of-pearl shield with a sgraffito plant motif, with two sets of twelve similar lateral pegs: five are rosewood (*Dalbergia* sp.) and seven

smaller ones are boxwood (*Buxus Sempervirens*). The front sides of the two pegbox flanks are decorated with mother-of-pearl plaques with a sgraffito geometric motif of alternating light and dark triangles.

Dendrochronological dating

Three different readings were taken on different parts of the soundboard to exclude sampling errors. The series of 64, 81 and 72 rings made it possible to construct a mean chronology of 89 rings dated to 1758 with the Reference chronology AMC01, T_{EP} 6,23, Glk 74,20***, and several others. The dating can be considered reliable.

State of conservation

The instrument is in fair condition. It was restored once, but neither the date nor restorer are known. At that time the tie-bridge was reconstructed, the bottom edge of the soundboard was reinforced with wood on the outside and some pegs were replaced. There is a crack along the entire length of the soundboard slightly to the left of the axis of symmetry. The bowl is in good condition but the capping strip has a long horizontal crack due to shrinkage. There are evident traces left by gut frets on the edges of the neck near the edge of the fingerboard.

Historical documentation

The first certain documentation of the instrument being in the collection is the 1911 catalogue.

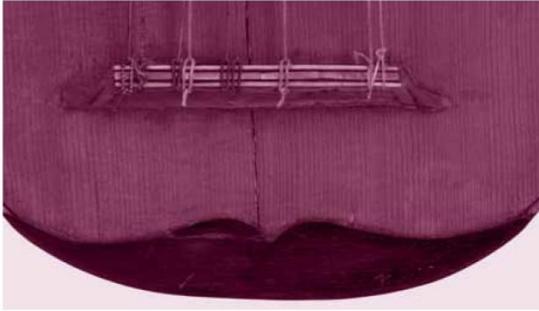

Critical history

The first mention of this instrument, which was probably already in the Conservatorio Cherubini Collection, dates from 1884 when Valdrighi, immediately followed by De Piccolellis (1885), based the biographical information about the two Milanese makers on this label.

In 1911 Bargagna defined it as a "small, carefully made instrument" and transcribed – as De Piccolellis already had – the text of the label. However, he incorrectly gave the year of fabrication as 1763, an error that was repeated by Vannes (1979). Gai (1969) corrected the date to 1764. In 1980, the mandolin was displayed in the exhibition held in Palazzo Vecchio and Palazzo Pitti; the catalogue highlighted the fine construction.

Stylistic notes

All the fundamental parts of the instrument are intact, and the restoration did not compromise its legibility. It presents all the features of Milanese mandolins made during the second half of the eighteenth century (six double courses, gut frets); the materials and decorations place it in the upper bracket of production. The attribution to the Fiscer brothers, as per the label, can be fully confirmed on the basis of a stylistic comparison with

two other surviving instruments from their workshop: the one in Milan, Castello Storzeseo, inv. no. 212, from 1759; and the Eisenach instrument, Bach Haus, cat. 1976 I-11, from 1780. Comparing this instrument to the one in Milan, we see that the style is the same, as is the motif on the rosette (here supported by three rather than five braces), the sophisticated decorations on the fingerboard and the shield on the peghead and the way it is curved (however, there is a slight difference in the angle of the shield with respect to the fingerboard). The capping strip, though not identical, is similar. The mandolin presented here is slightly big-

ger than the one in Milan (Overall + 23 mm; diapason + 16 mm) not because the neck is longer (the neck of the Milan instrument has been shortened, and now is identical in length to this mandolin's neck) because the bowl comprises two more ribs. These features are shared with the instrument dated 1780 which also has the same number of braces under the rosette and is decorated with the same materials and motifs.

Thomas Culliford
(Penzance, 1747-London?, 1821)

description is an exact match to our instrument. Furthermore, the document states that the machine stop made it possible to achieve dynamic changes gradually or suddenly, creating sounds much like those of the pianoforte that was already popular in England during the period.

As to the authenticity of the machine stop on the instrument described here, the qualitative difference between some mechanical parts (such as the main and the three secondary springs) and the obvious modifications such as the hand-widened slots on the plates of the 8' and lute registers – factors that led Mobbs and Mackenzie to maintain that the harpsichord is not in its original state (MOBBS - MACKENZIE 1994, pp. 39-40) – could be due to the use of parts made in series for two-manual instruments. By making a few modifications and adding some parts, it was possible to adapt the same components to making one-manual harpsichords for which there was a smaller market, potentially making production less expensive because they were built with series-made parts.

Details in **Woodwind** Instruments
deserving special attention for imaging

Tom Lerch

Musikinstrumenten-Museum
Staatliches Institut für
Musikforschung

21. Mai 2015

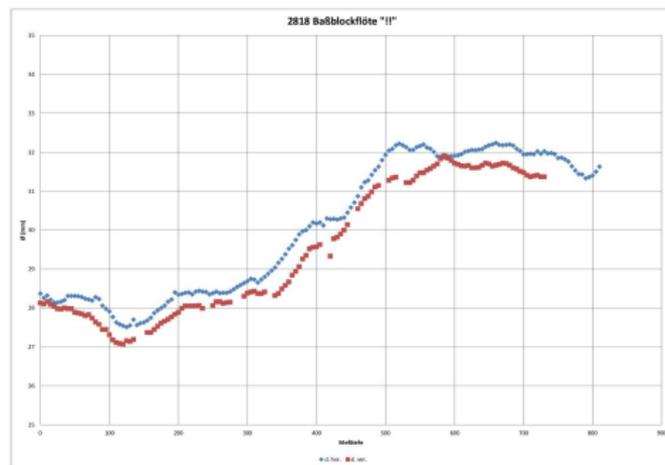

The acoustic of woodwind instruments is i. a. defined by:

- 3D-shape of bore
- position of mouth- and toneholes
- 3D-shape of mouth- and toneholes
- position and size of window and labium
- 3D-shape of windway
- mouthpiece (single or double reeds)

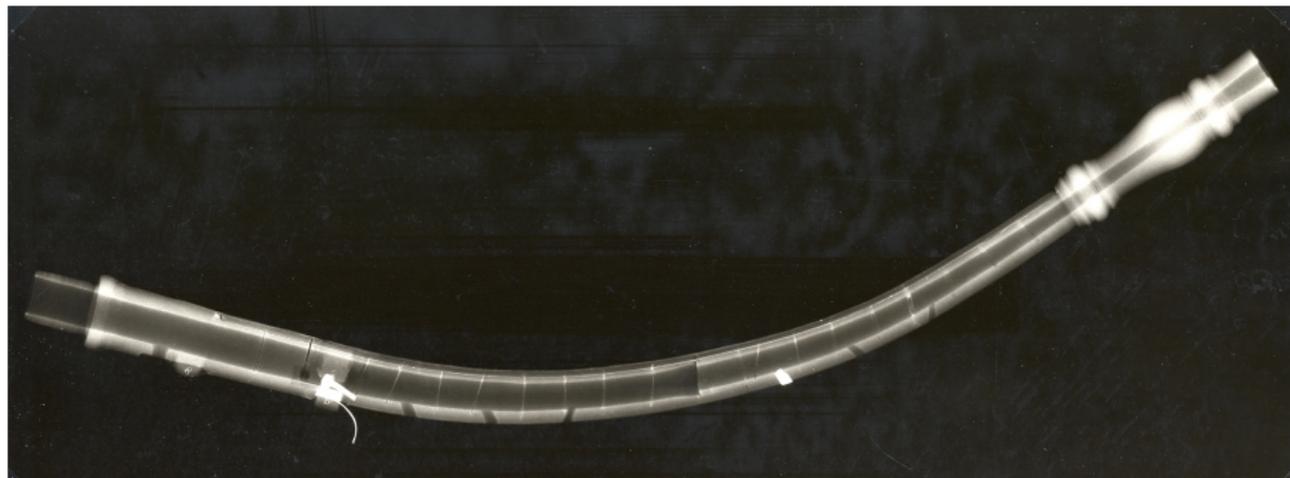

Measuring

Measuring and evaluating these parameters is not trivial:

- bores are relatively narrow and deep
- bores are deformed in longitudinal and transverse section
- bore shapes may be convex or curved
- corpus material may be susceptible or damaged

WEDGES
All measurements in millimeters. The
wedges are shown from the top and bottom
unless otherwise indicated or on both ends

Fret 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100	1.0, 1.5, 2.0, 2.5, 3.0, 3.5, 4.0, 4.5, 5.0, 5.5, 6.0, 6.5, 7.0, 7.5, 8.0, 8.5, 9.0, 9.5, 10.0, 10.5, 11.0, 11.5, 12.0, 12.5, 13.0, 13.5, 14.0, 14.5, 15.0, 15.5, 16.0, 16.5, 17.0, 17.5, 18.0, 18.5, 19.0, 19.5, 20.0, 20.5, 21.0, 21.5, 22.0, 22.5, 23.0, 23.5, 24.0, 24.5, 25.0, 25.5, 26.0, 26.5, 27.0, 27.5, 28.0, 28.5, 29.0, 29.5, 30.0, 30.5, 31.0, 31.5, 32.0, 32.5, 33.0, 33.5, 34.0, 34.5, 35.0, 35.5, 36.0, 36.5, 37.0, 37.5, 38.0, 38.5, 39.0, 39.5, 40.0, 40.5, 41.0, 41.5, 42.0, 42.5, 43.0, 43.5, 44.0, 44.5, 45.0, 45.5, 46.0, 46.5, 47.0, 47.5, 48.0, 48.5, 49.0, 49.5, 50.0, 50.5, 51.0, 51.5, 52.0, 52.5, 53.0, 53.5, 54.0, 54.5, 55.0, 55.5, 56.0, 56.5, 57.0, 57.5, 58.0, 58.5, 59.0, 59.5, 60.0, 60.5, 61.0, 61.5, 62.0, 62.5, 63.0, 63.5, 64.0, 64.5, 65.0, 65.5, 66.0, 66.5, 67.0, 67.5, 68.0, 68.5, 69.0, 69.5, 70.0, 70.5, 71.0, 71.5, 72.0, 72.5, 73.0, 73.5, 74.0, 74.5, 75.0, 75.5, 76.0, 76.5, 77.0, 77.5, 78.0, 78.5, 79.0, 79.5, 80.0, 80.5, 81.0, 81.5, 82.0, 82.5, 83.0, 83.5, 84.0, 84.5, 85.0, 85.5, 86.0, 86.5, 87.0, 87.5, 88.0, 88.5, 89.0, 89.5, 90.0, 90.5, 91.0, 91.5, 92.0, 92.5, 93.0, 93.5, 94.0, 94.5, 95.0, 95.5, 96.0, 96.5, 97.0, 97.5, 98.0, 98.5, 99.0, 99.5, 100.0
---	---

Notes all paraffin-based dyes are
non-toxic. Paraffin-based dyes are
used on the back and also on some of
the frets. The dyes are used on the
inside of the frets and on the edge
of the woodblock. The dyes are used
on the frets and on the edge of the
woodblock. The dyes are used on the
frets and on the edge of the woodblock.
The dyes are used on the frets and on
the edge of the woodblock. The dyes are
used on the frets and on the edge of the
woodblock. The dyes are used on the
frets and on the edge of the woodblock.
